

ABSTRACT

This is a hose reel for winding up a hose. The invention provides a hose reel capable of neatly winding up a hose. The frame of a hose reel is configured of a body case, and the drum for winding up the hose is rotatably supported in the body case. A guide part for guiding the hose is disposed on the moving path of the hose to be wound up by the drum, the path being the front face of the upper vessel of the body case. The guide part is provided with an inlet/outlet through which the hose is inserted, and the upper opening edge of the inlet/outlet constitutes an upper restrictive part to obstruct the hose from escaping upward. The upper restrictive part extends in a direction crossing the moving direction of the hose to be wound, and forms an arch shape whose central part protrudes upward.
